

AI Incident Triage & Response Coordinator Report

Incident ID: INC-60001
Incident Title: Storage Capacity Alert
Reported Severity: SEV-2
Service: Enterprise Storage Platform

1. Executive Summary

The Enterprise Storage Platform has exceeded critical storage utilization thresholds, reaching 97% capacity utilization. A capacity alert has been triggered, indicating an elevated risk of service degradation and potential outage if storage consumption continues to increase.

Based on the incident characteristics, this incident is classified as a Capacity Management Incident involving storage exhaustion risk. While no confirmed outage has occurred, the platform is operating with minimal remaining capacity, creating a significant operational risk that could affect application performance, write operations, data ingestion processes, and customer workloads.

Immediate action is recommended to prevent capacity exhaustion and avoid escalation into a SEV-1 service outage.

2. Incident Classification

Category	Classification
Primary Type	Capacity Management
Sub-Type	Storage Capacity Exhaustion
Incident Pattern	Storage Full / Disk Space Exhausted
Service Domain	Infrastructure / Storage
Operational Risk	High

Classification Rationale

The incident matches the predefined Capacity Management category because:

- Storage utilization is at 97%
- Capacity monitoring alert has been triggered
- Business impact indicates outage risk
- Storage exhaustion is a known precursor to service disruption

Classification Confidence: 94%

3. Severity Assessment

Current Severity

Reported Severity: SEV-2

AI Assessment

Recommended Severity: SEV-2 (Validated)

Justification

The incident meets typical SEV-2 characteristics:

- Service remains operational
- Customer impact is potential rather than confirmed
- Business risk is significant
- Immediate action required to prevent escalation
- Potential outage scenario exists

Escalation Criteria

Recommend escalation to SEV-1 if:

- Storage utilization exceeds 99%
 - Write failures begin occurring
 - Customer transactions are impacted
 - Data ingestion stops
 - Critical applications become unavailable
-

4. Impact Assessment

Customer Impact

Current

- Potential performance degradation
- Risk of latency increase
- Risk of write-operation failures
- Risk of application instability

Potential Future Impact

If storage reaches full capacity:

- File uploads may fail
- Database writes may be rejected
- Backup operations may stop
- Customer-facing applications may experience outages

Business Impact

Current

- Elevated operational risk
- Increased incident response activity
- Potential SLA risk

Potential

- Service outage
- Customer dissatisfaction
- Revenue impact from downtime
- Increased support volume

Business Impact Severity: High

5. Impacted Services

Directly Impacted

- Enterprise Storage Platform

Potentially Impacted Dependencies

- Application Services utilizing storage
- Databases hosted on storage volumes
- Backup systems
- Data processing jobs
- File management services

Blast Radius Assessment

Area	Risk Level
Storage Service	High
Applications Using Storage	Medium
Backup Systems	Medium
Customer Transactions	Medium
Network Infrastructure	Low

6. Probable Root Cause Analysis

Most Likely Cause

Storage consumption has increased beyond expected growth thresholds, resulting in available capacity falling below operational safety margins.

Potential Contributors

1. Unexpected data growth
2. Log accumulation
3. Backup retention issues
4. Temporary file buildup
5. Storage provisioning lag
6. Capacity forecasting gaps

Evidence

Observed indicators:

- Capacity utilization reached 97%
- Capacity alert triggered
- Business impact indicates outage risk

Root Cause Confidence

Hypothesis	Confidence
Capacity Exhaustion	90%
Uncontrolled Data Growth	80%
Backup Retention Issue	65%
Storage Misconfiguration	40%

7. Change Correlation Analysis

Recent Changes

No recent changes were provided in the incident payload.

Assessment

Unable to determine direct change correlation.

Recommended Investigation

Review:

- Last 7 days of deployments
 - Storage configuration changes
 - Capacity increases or reductions
 - Backup configuration updates
 - Infrastructure modifications
-

8. Recommended Ownership

Primary Owner

Storage Engineering Team / Storage SRE

Responsibilities:

- Capacity investigation
- Storage expansion planning
- Volume management
- Performance validation

Secondary Owners

Platform Engineering

Responsibilities:

- Application impact assessment
- Dependency analysis

Operations Team

Responsibilities:

- Monitoring
 - Communications
 - Incident coordination
-

9. Incident Command Recommendations

Recommended Roles

Role	Recommendation
Incident Commander	Assign
Storage SME	Required
Platform Engineer	Recommended
Communications Lead	Recommended

War Room Recommendation

Recommendation: Yes

Reason:

- High utilization threshold exceeded
- Potential for rapid escalation
- Cross-functional coordination may be needed

Communication Cadence

Severity	Update Frequency
SEV-2	Every 30 minutes
SEV-1 Escalation	Every 15 minutes

10. Immediate Mitigation Actions

Priority 1 (Immediate)

- 1. Validate storage utilization metrics.
- 2. Identify largest consumers of storage.
- 3. Review growth rate trends.
- 4. Check available expansion capacity.
- 5. Verify monitoring accuracy.

Priority 2 (Short-Term)

- 1. Remove unnecessary temporary files.
- 2. Archive unused datasets.
- 3. Expand available storage if approved.
- 4. Reduce noncritical data retention.

Priority 3 (Preventive)

- 1. Improve capacity forecasting.
 - 2. Create earlier warning thresholds.
 - 3. Review storage growth patterns.
 - 4. Establish automated reclamation processes.
-

11. Runbook Recommendation

Recommended Runbook

Storage Capacity Exhaustion Response Runbook

Suggested Activities

- 1. Validate utilization alert.
- 2. Determine affected storage pools.
- 3. Identify top consumers.
- 4. Assess business impact.
- 5. Execute approved capacity recovery actions.
- 6. Monitor post-mitigation stability.

Runbook Match Confidence

91%

12. Escalation Matrix

Condition	Action
Capacity > 97%	Storage Team Engagement
Capacity > 99%	SEV Review
Write Failures	Immediate Escalation
Customer Impact Confirmed	Incident Commander Escalation
Service Unavailable	Escalate to SEV-1

13. Stakeholder Communication Draft

Technical Update

The Incident Response Team is investigating elevated storage utilization on the Enterprise Storage Platform. Current utilization has reached 97%, triggering a capacity management alert. Service remains operational. Mitigation activities are underway to prevent degradation or outage.

Leadership Update

A high-risk storage capacity event has been identified affecting the Enterprise Storage Platform. No confirmed outage exists at this time. Engineering teams are actively assessing capacity consumption and mitigation options. The incident currently remains SEV-2 due to outage risk but has not impacted service availability.

14. Timeline

Event	Status
Capacity Growth	Observed
Alert Triggered	Confirmed
Incident Opened	Confirmed
Triage Initiated	In Progress
Mitigation Selected	Pending
Capacity Stabilized	Pending
Incident Resolved	Pending

15. Postmortem Preparation

If the incident escalates or requires formal review, capture:

Contributing Factors

- Capacity planning effectiveness
- Monitoring threshold adequacy
- Data growth forecasting accuracy
- Storage lifecycle management

Candidate Action Items

- Review capacity forecasting model
 - Add predictive storage alerts
 - Automate storage cleanup tasks
 - Improve storage utilization dashboards
 - Define escalation triggers earlier
-

16. Confidence Score

Area	Confidence
Incident Classification	94%
Severity Recommendation	90%
Ownership Recommendation	92%
Mitigation Recommendations	88%
Root Cause Hypothesis	75%
Overall Assessment	88%

17. Human-in-the-Loop Governance

AI Recommendations Only

Classification
Severity validation
Ownership recommendations
Mitigation recommendations
Communications support
Executive summaries

Human Approval Required

Service restart
Capacity expansion approval
Production changes
Rollback decisions
Incident closure
Postmortem sign-off

Final Recommendation: Treat this as a high-priority SEV-2 Capacity Management Incident. Engage Storage SRE ownership immediately, perform storage consumption analysis, and prepare contingency plans before utilization exceeds 99% and the incident risks escalating into a service outage.
